

Odoo to Relevance Knowledge Base Integration

Technical Implementation Guide

1. Overview

This document describes the complete technical process used to build a **knowledge base for Relevance AI** by extracting critical business data from **Odoo ERP** and pushing it into **Relevance's vector-based knowledge system** using **Make (Integromat) API workflows**.

The purpose of this integration is to allow users to **query business data inside Relevance AI** in a natural language format, enabling intelligent search, analytics, and AI-powered insights using real-time operational data.

2. Objectives of the System

- Create a centralized knowledge base in **Relevance AI**
- Extract structured business data from **Odoo ERP**
- Transform and standardize data using **Make.com**
- Push cleaned and structured data into **Relevance AI**
- Enable natural language querying on:
 - Products
 - Inventory
 - Sales
 - Purchases

- Manufacturing data
-

3. Architecture Overview

The integration includes 4 primary components:

- **Odoo ERP** – Main data source
- **Make.com (Integromat)** – Middleware for automation, cleaning, and transformation
- **Relevance AI API** – Knowledge base & vector storage
- **User / AI Agent** – Natural language interaction layer

Data Flow:

Odoo → Make.com → Relevance AI → User / AI Agent

4. Authentication & Setup

4.1 Odoo Authentication

Connection to Odoo was established using REST API through Make, authenticated using:

- Database name
- Username
- Password / API key

4.2 Relevance AI Authentication

Connection to Relevance AI was established using:

- API Key

- Dataset / Knowledge Base ID

4.3 Make.com Configuration

Separate scenarios (workflows) were created in Make for each data category. Each scenario contains:

1. HTTP module to fetch data from Odoo
2. Data transformation modules (clean + map)
3. HTTP module to push data into Relevance AI

5. Types of Data Pushed into Relevance

The following Odoo modules were integrated and sent to Relevance A (some might be missing here I:

5.1 Products Data

Source: Odoo – product.template, product.product

Fields Included:

- Product Name
- SKU
- Category
- Price
- Cost
- Description
- Unit of Measure

Use in Relevance:

- Product search
 - Pricing queries
 - Item-based analysis
 - Product recommendations
-

5.2 Inventory Data

Source: Odoo – stock.quant, stock.location

Fields Included:

- Product ID
- Available Quantity
- Reserved Quantity
- Location/Warehouse
- Stock Status

Use in Relevance:

- Stock level checking
 - Low-stock identification
 - Warehouse-based queries
-

5.3 Sales Data

Source: Odoo – sale.order

Fields Included:

- Order ID
- Customer
- Order Date
- Total Amount
- Status
- Salesperson

Use in Relevance:

- Sales analytics
- Revenue tracking
- Customer purchase behavior

5.4 Sales Order Line Data

Source: Odoo – sale.order.line

Fields Included:

- Order ID
- Product
- Quantity
- Unit Price
- Discount
- Line Total

Use in Relevance:

- Best-selling products
 - Order composition analysis
 - Product demand trends
-

5.5 Purchasing Data

Source: Odoo – purchase.order

Fields Included:

- Supplier
- Order Date
- Total Cost
- Order Status
- Reference ID

Use in Relevance:

- Supplier analysis
 - Procurement understanding
 - Cost comparison
-

5.6 Purchase Order Line Data

Source: Odoo – purchase.order.line

Fields Included:

- Product Name

- Quantity Ordered
- Unit Cost
- Total Value

Use in Relevance:

- Supplier pricing analysis
 - Product procurement cost tracking
-

5.7 Manufacturing Data

Source: Odoo – mrp.production

Fields Included:

- Production ID
- Product Name
- Quantity
- Start and End Date
- Status

Use in Relevance:

- Manufacturing progress tracking
 - Productivity analysis
 - Production efficiency monitoring
-

5.8 Manufacturing MRP / Production Line Data

Source: Odoo – mrp.workorder / mrp.production.line

Fields Included:

- Raw Materials
- Consumed Quantity
- Production Steps
- Component Usage

Use in Relevance:

- Raw material consumption tracking
- Waste reduction analysis
- Process optimization

6. Data Processing & Transformation Steps

Before sending data to Relevance AI, the following processing steps were applied in Make:

- Removed null and invalid entries
- Standardized date formats (ISO)
- Normalized numeric fields (price, quantity, cost)
- Mapped Odoo field names to Relevance structure
- Removed unnecessary fields
- Converted records into readable AI-friendly format

Example structure sent to Relevance:

Title: Sale #SO1025

Type: Sales Order

Content: Customer: ABC Ltd, Total: 1200, Products: 5
Metadata:

- Source: Odoo
- Date: 2024-12-01
- Category: Sales

This format supports semantic search inside Relevance AI.

7. Relevance Knowledge Base Structure

Inside Relevance AI, data was organized into the following sections:

- Products
- Inventory
- Sales
- Sales Lines
- Purchases
- Purchase Lines
- Manufacturing
- Production Lines

Each section is semantically indexed, allowing intelligent AI-based searches and Q&A.

8. Sample Queries That Can Now Be Performed

- Which products have the lowest stock?

- Show total sales for last month
- What is the most sold item this quarter?
- Which supplier has the best pricing?
- How much material is used in a specific production batch?
- What manufacturing orders are still in progress?

These queries are directly powered by the Relevance AI knowledge base.

9. Key Benefits to the Client

- Centralized AI-powered business data system
 - Natural language access to ERP data
 - Reduced manual reporting workload
 - Faster decision-making
 - High accuracy & consistency
 - Scalable for future expansion
 - Ready for AI agent integration
-

10. Future Enhancements

- Scheduled automatic syncing (hourly/daily)
 - Integration of odoo pos with clover
-

11. Summary

This integration successfully transforms Odoo business data into an AI-accessible knowledge base inside Relevance AI.

The organization can now analyze, search, and understand its data using **simple natural language queries**, making the system intelligent, accessible, and scalable.
